Executive Summary

The AuthCenter and Single Sign-On (SSO) system represents a comprehensive centralized authentication solution designed to streamline user management across multiple domains and applications. This implementation provides a unified authentication experience while maintaining robust security standards and administrative control.

The system serves as the central authentication hub for multiple subdomains including Solucomp, CCMS (Client Contact Management System), and Job Finder, enabling seamless user experience across all platforms. Users can authenticate once and access all authorized domains without repeated login processes, significantly improving user experience and operational efficiency.

The architecture follows industry best practices with a separation of concerns approach, featuring a dedicated AuthCenter backend service, an administrative panel for comprehensive management, and standardized SSO integration across all connected domains.

System Architecture

Core Components

The AuthCenter system is built on a modular architecture consisting of three primary components:

AuthCenter Backend Service: The core authentication engine responsible for user verification, session management, and secure token generation. This service acts as the single source of truth for all user authentication data and manages cross-domain communication protocols.

Administrative Panel: A comprehensive management interface providing administrators with full control over users, domains, and system configurations. The panel offers real-time analytics, user management capabilities, and domain access control features.

SSO Integration Layer: A standardized integration framework that connects all subdomain applications to the central AuthCenter, ensuring consistent authentication behavior across all platforms.

Infrastructure Design

The system is deployed on a cPanel server environment, ensuring reliable hosting with professional-grade server management capabilities. The architecture supports horizontal scaling and can accommodate growing user bases and additional domain integrations.

The design implements a hub-and-spoke model where AuthCenter serves as the central hub, and all subdomain applications connect as spokes. This architecture ensures centralized control while maintaining the independence of individual applications.

Technology Stack

Backend Technologies

Laravel Framework: The system is built on Laravel 12, leveraging its robust features including Eloquent ORM, middleware system, and built-in security features. Laravel's architecture provides a solid foundation for handling complex authentication scenarios and API integrations.

Database Management: MySQL serves as the primary database system, chosen for its reliability, performance, and extensive Laravel integration. The database design follows normalization principles to ensure data integrity and optimal query performance.

Authentication Libraries: The implementation utilizes Laravel Sanctum for API token management and JWT (JSON Web Tokens) for secure cross-domain authentication. These libraries provide industry-standard security features and seamless integration capabilities.

Frontend Technologies

React Framework: The administrative panel is developed using React, providing a dynamic and responsive user interface. The component-based architecture ensures maintainable and scalable frontend development.

Vite Build System: The frontend utilizes Vite for fast development builds and optimized production deployments, enhancing development productivity and application performance.

Development Standards

The codebase adheres to PSR-12 coding standards, ensuring consistency and maintainability across the entire development. These standards promote best practices in PHP development and facilitate code reviews and collaboration.

AuthCenter Core System

User Management Infrastructure

The AuthCenter maintains a comprehensive user registry that serves as the master database for all user information across connected domains. Each user record contains essential authentication data, profile information, and domain access permissions.

The system implements a unified user model that synchronizes across all connected applications, ensuring data consistency and eliminating the need for duplicate user accounts across different platforms. When users update their information on any connected domain, these changes propagate automatically to AuthCenter and all other authorized domains.

Session Management

Advanced session management capabilities ensure secure and efficient user authentication across multiple domains. The system generates secure tokens that maintain user sessions across different applications while providing administrators with visibility into active sessions and user activity patterns.

Session security features include automatic token expiration, secure token refresh mechanisms, and comprehensive audit logging for all authentication events. These features provide both security and administrative oversight of user access patterns.

Database Structure

The database architecture implements a normalized structure optimized for authentication workflows and cross-domain data synchronization. Primary entities include user profiles, domain registrations, access permissions, and audit logs.

Relationships between entities are carefully designed to support complex scenarios such as multi-domain user access, administrative hierarchies, and detailed activity tracking. The structure supports efficient querying while maintaining data integrity across all operations.

Admin Panel Features

Dashboard Analytics

The administrative dashboard provides comprehensive insights into system usage and performance metrics. Key performance indicators include total user count, domain registration statistics, and growth trends compared to previous periods.

User Analytics: Real-time tracking of user registrations, active sessions, and user engagement across all connected domains. Monthly growth rates and comparative analysis provide administrators with actionable insights into user adoption patterns.

Domain Statistics: Comprehensive tracking of domain performance including new registrations, user distribution across domains, and access pattern analysis. These metrics help administrators optimize domain configurations and identify growth opportunities.

Administrative Metrics: Detailed tracking of administrative activities, including admin user creation, configuration changes, and system maintenance activities. This provides accountability and audit trails for all administrative actions.

Session Monitoring: Real-time monitoring of active user sessions across the 24-hour period with growth rate calculations compared to previous periods. This feature helps administrators understand peak usage times and plan system resources accordingly.

Graphical Representations

The dashboard incorporates interactive charts and graphs that visualize key metrics in an easily digestible format. These visual elements include trend lines, comparative charts, and distribution graphs that provide immediate insights into system performance.

Monthly user registration trends are displayed through line charts showing registration patterns over time, helping administrators identify seasonal trends and plan marketing initiatives accordingly.

Recent Activity Monitoring

A comprehensive activity feed tracks all significant system events including user logins, logouts, administrative actions, and cross-domain authentication events. This real-time monitoring provides administrators with immediate visibility into system usage patterns.

The activity monitoring system captures detailed information about each event, including timestamps, user identities, source domains, and action types. This information supports both operational monitoring and security audit requirements.

Exportable Reports: Administrators can export comprehensive dashboard analytics to Excel files, including metrics such as total user counts, user growth rates, domain registration statistics, active session data, and user activities. These exports enable offline analysis, reporting, and strategic planning based on real-time system data.

User Management Module

Comprehensive User Administration: Administrators can view, edit, and manage all users registered in the AuthCenter system. The interface provides powerful search and filtering capabilities to quickly locate specific users or user groups.

Advanced Filtering Options: Multiple filter criteria including Domain, user status, enable administrators to segment users effectively for targeted management actions.

User Profile Management: Complete control over user profile information including name, email, password management, and account status. Changes made through the admin panel automatically synchronize across all connected domains.

Bulk Operations: Support for bulk user operations including status updates like (inactive or active), enabling efficient management of large user populations.

Account Status Control: Administrators can activate, deactivate, or delete user accounts with appropriate security controls. Deleted users are automatically removed from all connected domains, ensuring system-wide consistency.

Domain Management Module

Domain Registration: Administrators can register new domains into the AuthCenter system..

Security Controls: Enhanced security measures for critical operations such as domain deletion, which requires password confirmation to prevent accidental or unauthorized changes. These controls protect against administrative errors and potential security breaches.

Visual Management: Support for domain logos and visual elements that enhance the user experience during authentication flows. Administrators can upload and manage visual assets for each registered domain.

Site Access Info Setting

The **Site Access Info Setting** module allows users to view and manage site-specific information based on predefined filters. It provides a structured way to search and filter site records by customer name, site type, and site name. This module is designed to handle large data sets efficiently by using virtualization techniques to ensure smooth performance even when thousands of records are fetched.

Workflow

1. By default, the **Customer Name** filter is pre-selected.
2. The module contains **three (drop-downs)**:
 - **Customer Name** → Default value.
 - **Site Type** → User can select a site type. All available site types are listed in the drop-down.
 - **Site Name** → This drop-down remains disabled until a site type is selected. Once the user selects a site type, the corresponding site names are fetched from the backend and displayed here.
3. In the **Site Name** filter, the user can:
 - Select **All** site names.
 - Select a **single site name**.
 - Search and select a site name from the list.
4. After selecting a site name (or all), the system fetches and displays the related records from the backend.
5. Since records may be large in volume (thousands of entries), the system applies **virtualization** for efficient rendering and performance.

Site Access Info Upload

The **Site Access Info Upload** module provides functionality for uploading site-related Excel files into the system. It ensures that users can import large amounts of structured data quickly and reliably. The upload process is tracked in real-time through notifications, giving users visibility into the parsing progress, success, or errors. The module supports asynchronous handling of uploads, ensuring that performance is not compromised.

Workflow

1. When the user navigates to this module, the first step is to **select a file type**.
 - By default, only **two file types** are shown.
 - A file type must be selected before proceeding.
2. After selecting the file type, the user must upload an **Excel file**:
 - Only **.xls** and **.xlsx** formats are supported.
 - The maximum allowed file size is **50 MB**.

- Files can be uploaded via **drag & drop** or by **manual selection**.
3. Once a file is selected, the user clicks **Upload File**.
 - The file is then sent to the backend.
 - A progress bar is displayed to track the upload process.
 4. After uploading:
 - The file parsing process starts asynchronously.
 - A **task is added to the notification bar** at the top of the screen.
 - Each uploaded file creates a new task entry in the notifications.
 5. The task shows the **real-time parsing progress**:
 - Percentage completion.
 - Records being populated into the database.
 6. When the process is completed:
 - The notification updates to show that the file has been uploaded and parsed successfully.
 - If any errors are found (e.g., missing or invalid values), they are also displayed.
 7. Tasks are **temporary**:
 - They disappear when the page is refreshed.

Excel File Upload:

Excel File Upload

Upload large Excel files for site data processing

File Data Upload

Step 1: Select File Type

☐ Hub

Upload hub site data

☐ Small Cell

Upload small cell site data

Step 2: Select Excel File

Drag & drop your Excel file here

or click to browse files

Supports .xls and .xlsx files up to 50MB

Domain Settings and Access Control

- User-Domain Mapping:** Comprehensive interface for managing which users have access to which domains. Administrators can grant or revoke domain access on a per-user basis with immediate effect.
- Default Access Policies:** Configuration of default domain access for new user registrations, including automatic assignment of primary domains based on registration source and default access to common domains like Job Finder.

Account Status: Active

Your admin account is active and has full access to the system.

Create User Module

The **Create User Module** allows AuthCenter administrators to register new users into the system. The following fields are required to successfully create a user:

- **First Name** *(required)*
- **Last Name** *(required)*
- **Email Address** *(required, sanitized and unique)*
- **Password** *(required, min. 8 characters)*
- **Confirm Password** *(must match Password)*
- **Role** *(required: **Admin** or **User**)*

If the role selected is **User**, the individual will have standard access across assigned domains. If the role selected is **Admin**, the user will be recognized as an **AuthCenter administrator**.

Once created, if the credentials of an Admin user are shared and used to log in, that session will reflect **Admin privileges** across subdomains like **Job Finder**, **CCMS**, or **Solucomp**, where available and authorized.

Create User

Create Domain Module

The **Create Domain Module** allows administrators to register a new domain/subdomain within AuthCenter. The fields include:

- **Domain Name** *(required)*
- **Domain URL** *(required, must be unique or selected from existing subdomain dropdown)*
- **Domain Details** *(optional textual description)*
- **Domain Image** *(optional, max 2MB — formats: JPG, PNG, GIF, SVG)*

Once all fields are validated, clicking the **Create Domain** button will save the new domain entry in the system. The domain becomes available for assignment to users.

Create Domain

Domain Detail Module

The **Domain Detail Module** displays and manages the complete information of an existing domain. Admins can:

- View domain name, URL, details, and logo
- **Update:**
 - Domain name
 - Domain URL
 - Description
 - Domain image (replacing old image if provided, respecting format/size rules)

This module enables admins to keep domain information consistent and up-to-date.

The screenshot displays the 'Enterprise Application Details' page. At the top right, there is a notification bell icon, a user profile for 'Admin User Super Admin' with a 'Logout' link, and a blue 'Edit Enterprise Application' button. The main heading is 'Enterprise Application Details' with the subtitle 'View and manage enterprise application information'. The central form, titled 'Enterprise Application Information', contains the following fields: 'Enterpris Application Name' (with a globe icon and the value 'CCMS'), 'URL' (with a link icon and the value 'https://solucomp.com/ccms'), 'Detail (Optional)' (with a list icon and the value 'Client Contact Management System'), and 'Enterprise Application Image' (with a 'Current domain image' label and a placeholder image of a gold medal with a checkmark).

SSO Implementation

Common Authentication Pages

The SSO system implements a standardized set of authentication pages that provide a consistent user experience across all connected domains. These pages include a landing page, login interface, registration forms, and domain selection interface.

Universal Landing Page: A professional landing page that serves as the entry point for all SSO authentication flows.

Standardized Login Interface: A responsive and user-friendly login form that maintains consistent branding while supporting customization for different domain contexts. The interface includes error handling, validation feedback, and accessibility features.

Authentication Flow Design

The authentication flow is designed to provide seamless user experience while maintaining robust security standards. Users are automatically redirected through the authentication process with minimal manual intervention required.

Source Domain Detection: The system automatically detects the originating domain and maintains this context throughout the authentication process, enabling automatic redirection to the appropriate destination after successful authentication.

Session Persistence: Authenticated sessions persist across domain boundaries, allowing users to move between authorized domains without repeated authentication while maintaining appropriate security controls.

Error Handling: Comprehensive error handling ensures users receive clear feedback about authentication issues and guidance for resolution. Error messages are user-friendly while providing sufficient information for troubleshooting.

Cross-Domain Integration

Standardized API Endpoints: All domain integrations utilize standardized API endpoints that ensure consistent behavior and simplified maintenance. These endpoints support various authentication scenarios including initial login, session validation, and logout processing.

Token Management: Secure token-based authentication enables cross-domain session management while maintaining security boundaries between different applications. Tokens are automatically refreshed and validated to ensure continuous security.

User Authentication Flow

Registration Process

Multi-Source Registration: Users can register through any connected domain, with the system automatically capturing the source domain for proper access configuration. New registrations include automatic assignment of appropriate default domain access.

Default Domain Assignment: New users automatically receive access to their originating domain plus default access to the **Job Finder** domain, providing immediate value while allowing for customized access control as needed.

Profile Completion: Registration process includes optional profile completion steps that enhance user experience across all connected domains while maintaining registration simplicity.

Login Scenarios

Returning User Authentication: Existing users can authenticate through any connected domain with automatic redirection to their intended destination. The system maintains session context to ensure users reach their originally requested content after authentication.

Cross-Domain Session Management: Once authenticated, users can access all authorized domains without repeated login requirements. Session management ensures security while providing seamless user experience.

Domain-Specific Routing: The system intelligently routes users to appropriate domains based on their access permissions and intended actions, such as job applications or administrative functions.

Optional Domain Selection on Login

On the **Common Login Page**, users are provided with an optional **Domain Selection** feature to streamline redirection after authentication.

- A "**Show Domains**" toggle/button allows the user to view a list of available destination domains (e.g., **Solucom**, **CCMS**, **Job Portal**).
- After entering valid login credentials, the user can optionally select a preferred destination domain from the list.

Redirection Logic:

- If the user selects **Job Portal**, they are redirected to **Job Portal's main page** after successful login.
- If the user selects **Solucom**, they are redirected to the **Solucom website**.
- If the user selects **CCMS**, the system will redirect them to the **Choose Domain Page** for added security before accessing CCMS.

This feature enhances user experience by allowing users to directly land on their intended platform while maintaining centralized authentication control.

Choose Destination :

Domain Selection Process

Permission-Based Display: The domain selection interface displays all available domains while clearly indicating which domains are accessible to the current user. Inaccessible domains are shown for awareness but cannot be selected.

Search and Navigation: Users can search for specific domains or browse available options, with the interface providing clear indicators of domain purposes and access status.

Security Controls: The domain selection process includes appropriate security controls to prevent unauthorized access attempts while providing clear feedback about access limitations.

Authentication Security

Secure Redirect Handling:

All redirects from the centralized AuthCenter to subdomains are strictly validated to prevent open redirect vulnerabilities. Only pre-registered and trusted domain URLs are allowed as redirection targets, ensuring users reach only approved destinations.

Session Security and Token Lifecycle:

Authentication sessions follow strict Laravel and industry-standard security practices:

- Short-lived JWT tokens are issued for API authentication, with a well-defined Time To Live (TTL).
- Tokens are automatically refreshed using a secure refresh token mechanism, which prevents forced logout due to token expiry while ensuring continuous validation of session integrity.
- The same refresh mechanism is implemented across both user sessions and the AuthCenter admin panel, ensuring consistency and professional-grade token handling across all roles and domains.

Cross-Domain Token Validation and Sync:

To maintain trust between the centralized AuthCenter and its connected subdomains:

- Every inter-service API request (whether from a subdomain to AuthCenter or vice versa) includes a **secure sync token**.
- This sync token is validated at the receiving end before any sensitive action (e.g., user updates, permission sync, or authentication checks) is performed.
- If the token is invalid or tampered with, the request is immediately rejected, preventing unauthorized access or misuse.
- This mutual token validation mechanism ensures that both the AuthCenter and the subdomains maintain strict authentication integrity and follow a zero-trust communication model.

TOTP Security (Two-Factor Authentication)

The **TOTP (Time-based One-Time Password) Security** feature provides an additional layer of protection for user accounts within the AuthCenter. It is managed as a system-wide setting through the AuthCenter admin panel. When enabled, users must configure and use Google Authenticator (or any TOTP-compatible app) to complete account registration and login, ensuring stronger account security.

Workflow

- The feature is controlled from the **AuthCenter admin panel** as a system setting.
- If **TOTP is enabled**:
 - **During Signup(Must have to be configured even TOTP is enabled or disabled)**:
 - After submitting the signup form, a modal opens prompting the user to scan a **QR code** using the Google Authenticator app.
 - Once scanned, the user must enter the **6-digit verification code** generated by the authenticator app.
 - On submission, the TOTP is configured and linked to the user's account.
 - **During Login**:
 - After entering valid credentials, the system prompts the user to submit the **6-digit TOTP code**.
 - Access is granted only if the code is verified successfully.
- If a user has already created an account but has not configured TOTP:
 - When the user logs in, the same **QR code setup modal** will appear.
 - The user must configure TOTP before proceeding further.
- If TOTP verification is not completed, the user **cannot proceed** beyond signup or login.

Domain Management

Subdomain Integration

The system currently integrates three primary subdomains, each with specific characteristics and user access patterns:

Solucomp Integration: Comprehensive integration with the Solucom platform providing seamless authentication for all Solucom users. The integration supports both administrative and end-user authentication scenarios with appropriate access controls.

CCMS Integration: Specialized integration with the Client Contact Management System including enhanced security controls appropriate for content management workflows. CCMS integration includes administrative and users hierarchies and content-specific access controls.

Job Finder Integration: Universal integration with the Job Finder platform that serves as a default accessible domain for all users. This integration supports job application workflows and candidate management features.

Access Control Framework

Role-Based Access: Implementation of role-based access control that allows administrators to define user access patterns based on organizational roles and responsibilities. This framework supports complex organizational structures and access requirements.

Dynamic Access Management: Administrators can modify user access permissions in real-time with immediate effect across all connected domains. Changes are synchronized automatically without requiring user re-authentication.

Data Synchronization

Bi-Directional Synchronization

The system implements comprehensive bi-directional data synchronization ensuring that user information remains consistent across all connected domains regardless of where changes originate.

AuthCenter to Domain Sync: Changes made in the AuthCenter administrative panel automatically propagate to all connected domains where the affected user has access. This ensures immediate consistency across all platforms.

Domain to AuthCenter Sync: User profile changes made within individual domains automatically synchronize back to AuthCenter and then propagate to all other authorized domains. This maintains data consistency regardless of where users choose to update their information.

Real-Time Updates: Synchronization occurs in real-time where possible, with fallback mechanisms ensuring eventual consistency even in cases of temporary connectivity issues.

User Profile Management

Unified Profile System: User profiles are maintained as unified entities across all domains with AuthCenter serving as the authoritative source. Profile changes in any location update the master record and propagate to all connected systems.

Administrative Synchronization

Cross-Domain Administration: Administrative actions taken in any connected domain that affect user accounts automatically synchronize with AuthCenter and propagate to all relevant domains.

Security Features

Authentication Security

Token-Based Security: Implementation of industry-standard JWT tokens for secure cross-domain authentication with appropriate expiration and refresh mechanisms to balance security and user experience.

Password Security: Comprehensive password security policies including strength requirements, secure hashing algorithms, and protection against common password-based attacks.

Session Management: Advanced session management with secure session tokens, automatic timeout policies, and protection against session hijacking and other session-based attacks.

Administrative Security

Enhanced Admin Security: Administrative accounts include additional security measures such as stronger authentication requirements, and restricted access controls.

Critical Operation Controls: High-risk operations such as domain deletion require additional authentication steps including password confirmation to prevent unauthorized or accidental changes.

Cross-Domain Security

Origin Validation: Strict validation of domain origins and redirect destinations prevents unauthorized access attempts and protects against common web application vulnerabilities.

Token Scope Limitation: Authentication tokens are scoped appropriately to limit access to authorized domains and prevent token misuse across unauthorized applications.

Communication Security: All cross-domain communication utilizes secure protocols and includes appropriate validation mechanisms to ensure data integrity and prevent interception.

Data Protection

Encryption Standards: User data is protected using industry-standard encryption both in transit and at rest, ensuring privacy and compliance with data protection regulations.

Access Controls: Comprehensive access controls ensure that user data is only accessible to authorized users and administrators with appropriate permissions.

Conclusion

The AuthCenter and SSO implementation provides a comprehensive, secure, and scalable solution for centralized authentication across multiple domain applications. The system successfully addresses the complex requirements of modern multi-application environments while maintaining high security standards and excellent user experience.

The architecture supports future expansion and additional domain integrations while maintaining the robust security and administrative control features that ensure ongoing operational success. Regular monitoring and maintenance procedures ensure continued optimal performance and security compliance.

This implementation represents a significant advancement in authentication infrastructure, providing both immediate operational benefits and a foundation for future growth and enhancement of the overall application ecosystem.
